1 2 to 2 phase space

following [1]:

process:
$$\gamma^*(q) + g(k_1) \rightarrow Q(p_1) + \bar{Q}(p_2) \tag{1}$$

kinematics:

$$s = (q + k_1)^2 \qquad\qquad s' = s - q^2 \tag{2}$$
$$t = (k_1 - p_1)^2 \qquad\qquad t_1 = t - m^2 \tag{3}$$
$$u = (k_1 - p_2)^2 \qquad\qquad u_1 = u - m^2 \tag{4}$$

use c.m.s. of incoming particles:

$$q = \left(\frac{s + q^2}{2\sqrt{s}}, 0, 0, \ldots, -\frac{s - q^2}{2\sqrt{s}} \right) \tag{5}$$

$$k_1 = \frac{s - q^2}{2\sqrt{s}} (1, 0, 0, \ldots, 1) \tag{6}$$

such that
$$q + k_1 = (\sqrt{s}, \vec{0}) \qquad k_1^2 = 0 \tag{7}$$

for the outgoing particles it follows

$$p_1 = \frac{\sqrt{s}}{2} (1, 0, \beta \sin\theta, \ldots, \beta \cos\theta) \tag{8}$$

$$p_2 = \frac{\sqrt{s}}{2} (1, 0, -\beta \sin\theta, \ldots, -\beta \cos\theta) \tag{9}$$

with $\beta = \sqrt{1 - 4m^2/s}$ such that

$$p_1 + p_2 = (\sqrt{s}, \vec{0}) \qquad p_1^2 = p_2^2 = m^2 \tag{10}$$

use n-sphere:

$$d^D x = \Omega_D x^{D-1} dx = \frac{2\pi^{D/2}}{\Gamma(D/2)} x^{D-1} dx = \frac{\pi^{D/2}}{\Gamma(D/2)} (x^2)^{(D-2)/2} dx^2 \tag{11}$$

1

compute phase space:

$$PS_2 = \int \frac{d^n p_1}{(2\pi)^{n-1}} \frac{d^n p_1}{(2\pi)^{n-1}} (2\pi)^n \delta^{(n)}(q + k_1 - p_1 - p_2)\delta(p_1^2 - m^2)\delta(p_2^2 - m^2) \tag{12}$$

$$= \frac{1}{(2\pi)^{n-2}} \int d^n p_1 \, \delta((q + k_1 - p_2)^2 - m^2)\delta(p_1^2 - m^2) \tag{13}$$

$$= \frac{1}{(2\pi)^{n-2}} \int dp_{1,0} dp_{1,||} d^2 p_{1,\perp} d^{n-4}\hat{p}_1 \, \delta(s - 2p_{1,0}\sqrt{s})\delta(p_{1,0}^2 - p_{1,||}^2 - p_{1,\perp}^2 - \hat{p}_1^2 - m^2) \tag{14}$$

$$= \frac{\pi}{(2\pi)^{n-2} 2\sqrt{s}} \int dp_{1,||} dp_{1,\perp}^2 d^{n-4}\hat{p}_1 \, \delta(s/4 - p_{1,||}^2 - p_{1,\perp}^2 - \hat{p}_1^2 - m^2) \tag{15}$$

$$= \frac{\pi}{(2\pi)^{n-2} 2\sqrt{s}} \int dp_{1,||} d\hat{p}_1^2 \frac{\pi^{(n-4)/2}}{\Gamma((n-4)/2)}(\hat{p}_1^2)^{(n-6)/2} \tag{16}$$

$$= \frac{1}{2\sqrt{s}\Gamma((n-4)/2)(4\pi)^{(n-2)/2}} \int dp_{1,||} d\hat{p}_1^2 \, (\hat{p}_1^2)^{(n-6)/2} \tag{17}$$

Integration borders are

$$p_{1,||} \in \frac{\sqrt{s}}{2}\beta \cdot [-1, 1] \qquad \hat{p}_1^2 \in \left(\frac{s\beta^2}{4} - p_{1,||}^2\right) \cdot [0, 1] \tag{18}$$

if cross section does not depend on hat-space:

$$\int d\hat{p}_1^2 \, (\hat{p}_1^2)^{(n-6)/2} = \frac{2}{n-4}\left(\frac{s\beta^2}{4} - p_{1,||}^2\right)^{(n-4)/2} \tag{19}$$

$$\Rightarrow PS_2 = \frac{1}{2\sqrt{s}\Gamma((n-2)/2)(4\pi)^{(n-2)/2}} \int dp_{1,||} \left(\frac{s\beta^2}{4} - p_{1,||}^2\right)^{(n-4)/2} \tag{20}$$

rewrite $p_{1,||}$ to $\cos\theta$:

$$p_{1,||} = \frac{\sqrt{s}}{2}\beta \cos\theta \Rightarrow \quad dp_{1,||} = \frac{\sqrt{s}}{2}\beta \, d\cos\theta, \quad \cos\theta \in [-1, 1], \hat{p}_1^2 \in \frac{s\beta^2}{4}\left(1 - \cos^2\theta\right) \cdot [0, 1] \tag{21}$$

rewrite $\cos\theta$ to $t_1 = (k_1 - p_2)^2 - m^2$:

$$\cos\theta = \frac{2t_1/s' + 1}{\beta} \Rightarrow \quad d\cos\theta = \frac{2}{\beta s'}dt_1, \quad t_1 \in \frac{s'}{2}[-\beta - 1, \beta - 1], \hat{p}_1^2 \in \left(-m^2 - \frac{st_1}{s'^2}(s' + t_1)\right) \cdot [0, 1] \tag{22}$$

$$p_{1,||} = \sqrt{s}\left(\frac{t_1}{s'} + \frac{1}{2}\right) \Rightarrow \quad dp_{1,||} = \frac{\sqrt{s}}{s'}dt_1 \tag{23}$$

$$\Rightarrow PS_2 = \frac{1}{2s'\Gamma((n-2)/2)(4\pi)^{(n-2)/2}} \int dt_1 \left(\frac{(t_1(u_1 - q^2) - s'm^2)s' - q^2 t_1^2}{s'^2}\right)^{(n-4)/2} \tag{24}$$

2 2 to 3 phase space

following [2, 3, 1]:

process:
$$\gamma^*(q) + q(k_1) \rightarrow Q(p_1) + \bar{Q}(p_2) + q(k_2) \tag{25}$$

2.1 kinematic constraints

definitions of kinematic variables:

$$
\begin{aligned}
s &= (q + k_1)^2 & \Rightarrow && 2qk_1 &= s - q^2 = s' & (26) \\
s_3 &= (k_2 + p_2)^2 - m^2 & \Rightarrow && 2k_2p_2 &= s_3 & (27) \\
s_4 &= (k_2 + p_1)^2 - m^2 & \Rightarrow && 2k_2p_1 &= s_4 & (28) \\
s_5 &= (p_1 + p_2)^2 = -u_5 & \Rightarrow && 2p_1p_2 &= s_5 - 2m^2 & (29) \\
t_1 &= (k_1 - p_2)^2 - m^2 = t - m^2 & \Rightarrow && 2k_1p_2 &= -t_1 & (30) \\
t' &= (k_1 - k_2)^2 & \Rightarrow && 2k_1k_2 &= -t' & (31) \\
u_1 &= (q - p_2)^2 - m^2 = u - m^2 & \Rightarrow && 2qp_2 &= -u_1 + q^2 & (32) \\
u_6 &= (k_1 - p_1)^2 - m^2 & \Rightarrow && 2k_1p_1 &= -u_6 & (33) \\
u_7 &= (q - p_1)^2 - m^2 & \Rightarrow && 2qp_1 &= -u_7 + q^2 & (34) \\
u' &= (q - k_2)^2 & \Rightarrow && 2qk_2 &= -u' + q^2 & (35)
\end{aligned}
$$

impose momentum conservation:
$$q + k_1 = p_1 + p_2 + k_2 \tag{36}$$

contract with 2 times momentum:

$$2q^2 \quad +s - q^2 = -u_7 + q^2 \quad -u_1 + q^2 \quad -u' + q^2 \quad \Leftrightarrow \quad 0 = s + u_1 + u_7 + u' - 2q^2 \tag{37}$$

$$s - q^2 \quad\quad +0 = -u_6 \quad\quad -t_1 \quad\quad -t' \quad\quad \Leftrightarrow \quad 0 = s + t_1 + t' + u_6 - q^2 \tag{38}$$

$$-u_7 + q^2 \quad -u_6 = 2m^2 \quad +s_5 - 2m^2 \ +s_4 \quad \Leftrightarrow \quad 0 = s_4 + s_5 + u_6 + u_7 - q^2 \tag{39}$$

$$-u_1 + q^2 \quad -t_1 = s_5 - 2m^2 \ +2m^2 \quad +s_3 \quad \Leftrightarrow \quad 0 = s_3 + s_5 + t_1 + u_1 - q^2 \tag{40}$$

$$-u' + q^2 \quad -t' = s_4 \quad\quad +s_3 \quad\quad +0 \quad \Leftrightarrow \quad 0 = s_3 + s_4 + t' + u' - q^2 \tag{41}$$

$$\frac{1}{2}\left((37)+(38)+(40)-(39)-(41)\right)=0=s'+t_1+u_1-s_4 \tag{42}$$

$$\frac{1}{2}\left((37)+(38)+(41)-(39)-(40)\right)=0=s'+t'+u'-s_5 \tag{43}$$

2.2 choose framework

use c.m.s. of recoiling heavy and light quark $(Q(p_1)$ and $q(k_2))$:

$$k_2 = (\omega_2, k_{2,x}, \omega_2 \sin\theta_1 \cos\theta_2, \omega_2 \cos\theta_1, \hat{k}_2) \tag{44}$$

$$p_1 = (E_1, -k_{2,x}, -\omega_2 \sin\theta_1 \cos\theta_2, -\omega_2 \cos\theta_1, -\hat{k}_2) \tag{45}$$

where $k_{2,x}$ is such, that $k_2^2 = 0$.

The only remainding choice is then the alignment of the z-axis: either along k_1, called "Set I"(2.2.1), along q, called "Set II"(2.2.2) or along p_1, called "Set III"(2.2.3).

2.2.1 Set I

align k_1 to z-axis:

$$k_1 = (\omega_1, 0, 0, \omega_1, \hat{0}) \tag{46}$$

$$q = (q_0, 0, |\vec{p}_2| \sin\psi, |\vec{p}_2| \cos\psi - \omega_1, \hat{0}) \tag{47}$$

$$p_2 = (E_2, 0, |\vec{p}_2| \sin\psi, |\vec{p}_2| \cos\psi, \hat{0}) \tag{48}$$

constraints, from energy conservation, masses (light quark masses are already fixed: $k_1^2 = 0 = k_2^2$) and external Mandelstam variables:

$$q_0 + \omega_1 \qquad\qquad = E_1 + E_2 + \omega_2 \tag{49}$$

$$m^2 = p_1^2 \qquad\qquad = E_1^2 - \omega_2^2 \tag{50}$$

$$m^2 = p_2^2 \qquad\qquad = E_2^2 - |\vec{p}_2|^2 \tag{51}$$

$$q^2 \qquad\qquad = q_0^2 - |\vec{p}_2|^2 + 2|\vec{p}_2|\,\omega_1 \cos\psi - \omega_1^2 \tag{52}$$

$$s = (q + k_1)^2 \qquad\qquad = (q_0 + \omega_1)^2 - |\vec{p}_2|^2 \tag{53}$$

$$t = (k_1 - p_2)^2 \qquad\qquad = (\omega_1 - E_2)^2 - |\vec{p}_2|^2 + 2|\vec{p}_2|\,\omega_1 \cos\psi - \omega_1^2 \tag{54}$$

$$u = (q - p_2)^2 \qquad\qquad = (q_0 - E_2)^2 - \omega_1^2 \tag{55}$$

4

solve:

$$(53) - (52) + (54) - (51) + (55) = s - q^2 + t - m^2 + u \tag{56}$$

$$= s_4 + m^2 = (E_1 + \omega_2)^2 \tag{57}$$

$$(54) + (55) - (52) = t + u - q^2 = -2(E_1 + \omega_2)E_2 \tag{58}$$

$$\Rightarrow E_2 = -\frac{t + u - q^2}{2\sqrt{s_4 + m^2}} = \frac{s - s_4 - 2m^2}{2\sqrt{s_4 + m^2}} \tag{59}$$

$$(57) \wedge (50) \Rightarrow \omega_2 = \frac{s_4}{2\sqrt{s_4 + m^2}} \tag{60}$$

$$(57) \Rightarrow E_1 = \frac{s_4 + 2m^2}{2\sqrt{s_4 + m^2}} \tag{61}$$

$$(53) + (55) - (51) = s + u - m^2 = 2q_0(E_1 + \omega_2) \tag{62}$$

$$\Rightarrow q_0 = \frac{s + u_1}{2\sqrt{s_4 + m^2}} \tag{63}$$

$$(54) - (52) = t - q^2 = (\omega_1 - E_2)^2 - q_0^2 \tag{64}$$

$$\Rightarrow \omega_1 = \frac{s' + t_1}{2\sqrt{s_4 + m^2}} = \frac{s_4 - u_1}{2\sqrt{s_4 + m^2}} \tag{65}$$

$$(51) \Rightarrow |\vec{p}_2| = \sqrt{E_2^2 - m^2} = \frac{\sqrt{(s - s_4)^2 - 4sm^2}}{2\sqrt{s_4 + m^2}} \tag{66}$$

$$(52) \Rightarrow \cos\psi = \frac{q^2 - q_0^2 + |\vec{p}_2|^2 + \omega_1^2}{2|\vec{p}_2|\omega_1} \tag{67}$$

$$= \frac{(u_1 + m^2)(t_1 - s') - (m^2 - q^2 - t_1)(s' + t_1)}{(s' + t_1)\sqrt{(s - s_4)^2 - 4sm^2}} \tag{68}$$

$$\Rightarrow \sin\psi = 2\frac{\sqrt{s_4 + m^2}\sqrt{m^2 s'^2 + q^2 t_1(s' + t_1) - s' t_1 u_1}}{(s' + t_1)\sqrt{(s - s_4)^2 - 4sm}} \tag{69}$$

$$t' = -2k_1k_2 = -2\omega_1\omega_2(1 - \cos\theta_1) \tag{70}$$

$$u_6 = -2k_1p_1 = -2\omega_1(E_1 + \omega_2\cos\theta_1) \tag{71}$$

$$(38): \qquad 0 = s + t_1 + t' + u_6 - q^2 \quad \checkmark \tag{72}$$

t' is the only variable that can get collinear (for $-q^2 > 0$).

$$s_3 = 2k_2p_2 = 2\omega_2(E_2 - |\vec{p}_2|(\cos\psi\cos\theta_1 + \sin\psi\sin\theta_1\cos\theta_2)) \tag{73}$$

$$s_5 = (p_1 + p_2)^2 = 2m^2 + 2p_1p_2 \tag{74}$$

$$= 2(m^2 + E_1E_2 + \omega_2|\vec{p}_2|(\cos\psi\cos\theta_1 + \sin\psi\sin\theta_1\cos\theta_2)) \tag{75}$$

$$(40): \qquad 0 = s_3 + s_5 + t_1 + u_1 - q^2 \quad \checkmark \tag{76}$$

5

$$u' = (q - k_2)^2 = q^2 - 2qk_2 \tag{77}$$

$$= q^2 - 2(q_0\omega_2 - \omega_2(|\vec{p_2}|\cos\psi - \omega_1)\cos\theta_1 - \omega_2|\vec{p_2}|\sin\psi\sin\theta_1\cos\theta_2) \tag{78}$$

$$u_7 = q^2 - 2qp_1 \tag{79}$$

$$= q^2 - 2(q_0 E_1 + \omega_2(|\vec{p_2}|\cos\psi - \omega_1)\cos\theta_1 + \omega_2|\vec{p_2}|\sin\psi\sin\theta_1\cos\theta_2) \tag{80}$$

$$(37): \quad 0 = s + u_1 + u_7 + u' - 2q^2 \quad \checkmark \tag{81}$$

2.2.2 Set II

align q to z-axis:

$$q = (q_0, 0, 0, q_z, \hat{0}) \tag{82}$$

$$k_1 = (\omega_1, 0, |\vec{p_2}|\sin\psi, |\vec{p_2}|\cos\psi - q_z, \hat{0}) \tag{83}$$

$$p_2 = (E_2, 0, |\vec{p_2}|\sin\psi, |\vec{p_2}|\cos\psi, \hat{0}) \tag{84}$$

constraints, from energy conservation, masses ($k_2^2 = 0$ is already fixed) and external Mandelstam variables:

$$q_0 + \omega_1 \qquad = E_1 + E_2 + \omega_2 \tag{85}$$

$$m^2 = p_1^2 \qquad = E_1^2 - \omega_2^2 \tag{86}$$

$$m^2 = p_2^2 \qquad = E_2^2 - |\vec{p_2}|^2 \tag{87}$$

$$q^2 \qquad = q_0^2 - q_z^2 \tag{88}$$

$$0 \qquad = \omega_1^2 - |\vec{p_2}|^2 + 2|\vec{p_2}|q_z\cos\psi - q_z^2 \tag{89}$$

$$s = (q + k_1)^2 \qquad = (q_0 + \omega_1)^2 - |\vec{p_2}|^2 \tag{90}$$

$$t = (k_1 - p_2)^2 \qquad = (\omega_1 - E_2)^2 - q_z^2 \tag{91}$$

$$u = (q - p_2)^2 \qquad = (q_0 - E_2)^2 - |\vec{p_2}|^2 + 2|\vec{p_2}|q_z\cos\psi - q_z^2 \tag{92}$$

solve:

$$(92) - (89) = u = (q_0 - E_2)^2 - \omega_1^2 \tag{93}$$

$$(90) - (88) + (91) - (87) + (93) = s - q^2 + t - m^2 + u \tag{94}$$

$$= s_4 + m^2 = (\omega_1 + q_0 - E_2)^2 \tag{95}$$

$$(91) + (92) - (88) = t + u - q^2 = 2(E_2 - \omega_1 - q_0)E_2 \tag{96}$$

$$\Rightarrow E_2 = -\frac{t + u - q^2}{2\sqrt{s_4 + m^2}} = \frac{s - s_4 - 2m^2}{2\sqrt{s_4 + m^2}} = (59) \tag{97}$$

$$(90) - (88) + (91) - (87) = s - q^2 + t - m^2 = -2(E_2 - \omega_1 - q_0)\omega_1 \tag{98}$$

$$\Rightarrow \omega_1 = \frac{s' + t_1}{2\sqrt{s_4 + m^2}} = \frac{s_4 - u_1}{2\sqrt{s_4 + m^2}} = (65) \tag{99}$$

$$(95) \wedge (97) \wedge (99) \Rightarrow q_0 = \frac{s + u_1}{2\sqrt{s_4 + m^2}} = (63) \tag{100}$$

$$(90) \wedge (100) \wedge (99) \Rightarrow |\vec{p}_2| = \frac{\sqrt{(s - s_4)^2 - 4m^2 s}}{2\sqrt{s_4 + m^2}} = (66) \tag{101}$$

$$(88) \wedge (100) \Rightarrow q_z = \frac{\sqrt{(s' + u_1')^2 - 4q^2 t}}{2\sqrt{s_4 + m^2}} \tag{102}$$

$$(86) \Rightarrow \omega_2 = \frac{s_4}{2\sqrt{s_4 + m^2}} = (60) \tag{103}$$

$$u_6 = -2k_1 p_1 \tag{115}$$

$$= -2(\omega_1 E_1 + \omega_2(|\vec{p_2}|\cos\psi - q_z)\cos\theta_1 + \omega_2|\vec{p_2}|\sin\psi\sin\theta_1\cos\theta_2) \tag{116}$$

$$(38): \quad 0 = s' + t_1 + t' + u_6 \quad \checkmark \tag{117}$$

same as before: t' is the only variable that can get collinear (for $-q^2 > 0$) - now collinear as [ABC] variable.

2.2.3 Set III

align p_2 to z-axis:

$$q = (q_0, 0, |\vec{q}|\sin\psi, |\vec{q}|\cos\psi, \hat{0}) \tag{118}$$

$$k_1 = (\omega_1, 0, -|\vec{q}|\sin\psi, -|\vec{q}|\cos\psi + p_{2,z}, \hat{0}) \tag{119}$$

$$p_2 = (E_2, 0, 0, p_{2,z}, \hat{0}) \tag{120}$$

constraints, from energy conservation, masses ($k_2^2 = 0$ is already fixed) and external Mandelstam variables:

$$q_0 + \omega_1 \qquad = E_1 + E_2 + \omega_2 \tag{121}$$

$$m^2 = p_1^2 \qquad = E_1^2 - \omega_2^2 \tag{122}$$

$$m^2 = p_2^2 \qquad = E_2^2 - p_{2,z}^2 \tag{123}$$

$$q^2 \qquad = q_0^2 - |\vec{q}|^2 \tag{124}$$

$$0 \qquad = \omega_1^2 - |\vec{q}|^2 + 2|\vec{q}|\,p_{2,z}\cos\psi - p_{2,z}^2 \tag{125}$$

$$s = (q + k_1)^2 \qquad = (q_0 + \omega_1)^2 - p_{2,z}^2 \tag{126}$$

$$t = (k_1 - p_2)^2 \qquad = (\omega_1 - E_2)^2 - |\vec{q}|^2 \tag{127}$$

$$u = (q - p_2)^2 \qquad = (q_0 - E_2)^2 - |\vec{q}|^2 + 2|\vec{q}|\,p_{2,z}\cos\psi - p_{2,z}^2 \tag{128}$$

solve:

$$(128) - (125) = u = (q_0 - E_2)^2 - \omega_1^2 \tag{129}$$

$$(126) - (124) + (127) - (123) + (129) = s - q^2 + t - m^2 + u \tag{130}$$

$$= s_4 + m^2 = (\omega_1 + q_0 - E_2)^2 = (95) \tag{131}$$

$$(127) + (128) - (124) = t + u - q^2 = 2(E_2 - \omega_1 - q_0)E_2 \tag{132}$$

$$\Rightarrow E_2 = -\frac{t + u - q^2}{2\sqrt{s_4 + m^2}} = \frac{s - s_4 - 2m^2}{2\sqrt{s_4 + m^2}} = (59) = (97) \tag{133}$$

$$(126) - (124) + (127) - (123) = s - q^2 + t - m^2 = -2(E_2 - \omega_1 - q_0)\omega_1 \tag{134}$$

$$\Rightarrow \omega_1 = \frac{s' + t_1}{2\sqrt{s_4 + m^2}} = \frac{s_4 - u_1}{2\sqrt{s_4 + m^2}} = (65) = (99) \tag{135}$$

$$(131) \wedge (133) \wedge (135) \Rightarrow q_0 = \frac{s + u_1}{2\sqrt{s_4 + m^2}} = (63) = (100) \tag{136}$$

$$(124) \wedge (136) \Rightarrow |\vec{q}| = \frac{\sqrt{(s' + u_1')^2 - 4q^2 t}}{2\sqrt{s_4 + m^2}} = (102) \tag{137}$$

$$(122) \wedge (121) \Rightarrow E_1 = \frac{s_4 + 2m^2}{2\sqrt{s_4 + m^2}} = (61) = (104) \tag{138}$$

$$(121) \Rightarrow \omega_2 = \frac{s_4}{2\sqrt{s_4 + m^2}} = (60) = (103) \tag{139}$$

$$(123) \wedge (133) \Rightarrow p_{2,z} = \frac{\sqrt{(s - s_4)^2 - 4m^2 s}}{2\sqrt{s_4 + m^2}} = (66) = (101) \tag{140}$$

$$\tag{141}$$

same as before: t' is the only variable that can get collinear (for $-q^2 > 0$) - now collinear as [ABC] variable.

2.3 phase space integrals

at phase space integration there occur integrations over propagators[4, 2, 3]; the propagators can be decomposed in 2 types: [ab] and [ABC]; the needed integrals then reduce to the master formula:

$$I_n^{(k,l)} = \int_0^\pi d\theta_1 \, \sin^{n-3}(\theta_1) \int_0^\pi d\theta_2 \, \sin^{n-4}(\theta_2)(a + b\cos(\theta_1))^{-k}(A + B\cos(\theta_1) + C\sin(\theta_1)\cos(\theta_2))^{-l} \tag{142}$$

$$= \int d\Omega_n \, (a + b\cos(\theta_1))^{-k}(A + B\cos(\theta_1) + C\sin(\theta_1)\cos(\theta_2))^{-l} \tag{143}$$

the integrals can be further destinguished by the range of k, l and the type of collinearity (following the notation in [4]):

9

- "non collinear": $a^2 \neq b^2 \wedge A^2 \neq B^2 + C^2 \to I_{0,n}^{(k,l)}$

- "single collinear a": $a = -b \wedge A^2 \neq B^2 + C^2 \to I_{a,n}^{(k,l)}$

- "single collinear A": $a^2 \neq b^2 \wedge A^2 = B^2 + C^2 \to I_{A,n}^{(k,l)}$

- "double collinear": $a = -b \wedge A = -\sqrt{B^2 + C^2} \to I_{aA,n}^{(k,l)}$

Use $n = 4 + \epsilon$.

2.3.1 integral helper

define helper integral

$$\hat{I}^{(q)}(\nu) := \int_0^\pi dt \, \sin^{\nu-3}(t) \cos^q(t) \tag{144}$$

It is[5, eq. 5.12.6]:

$$\int_0^\pi (\sin t)^{\alpha-1} e^{i\beta t} dt = \frac{\pi}{2^{\alpha-1}} \frac{e^{i\pi\beta/2}}{\alpha \, B\left((\alpha+\beta+1)/2, (\alpha-\beta+1)/2\right)} \qquad \text{if } \Re(\alpha) > 0 \tag{145}$$

$$\Rightarrow \hat{I}^{(0)}(n) = \frac{\pi}{2^{n-3}(n-2)} \frac{1}{B((n-1)/2, (n-1)/2)} \tag{146}$$

$$\Rightarrow \hat{I}^{(0)}(n-1) = \frac{\pi}{2^{n-4}(n-3)} \frac{1}{B((n-2)/2, (n-2)/2)} = B((n-3)/2, 1/2) \tag{147}$$

If q is odd: $\hat{I}^{(q)} = 0$, due to symetry of kernel; if q is even: $q = 2p$ with $p \in \mathbb{N}$:

$$\hat{I}^{(2p)}(\nu) = \frac{1}{2^{2p}} \sum_{k=0}^{2p} \binom{2p}{k} \int_0^\pi \sin^{\nu-3}(t) \exp(2i(k-p)t)\, dt \tag{148}$$

$$= \frac{\pi}{2^{2p+\nu-3}(\nu-2)} \sum_{k=0}^{2p} \binom{2p}{k} \frac{\exp(i\pi(k-p))}{B((\nu-1)/2+(k-p),(\nu-1)/2-(k-p))} \tag{149}$$

$$= \frac{\pi}{2^{2p+\nu-3}(\nu-2)} \sum_{l=-p}^{p} \binom{2p}{p+l} \frac{(-1)^l}{B((\nu-1)/2+l,(\nu-1)/2-l)} \tag{150}$$

$$= \frac{\pi\Gamma(\nu-1)(2p)!}{2^{2p+\nu-3}(\nu-2)\Gamma(\frac{n-1}{2}+p)\Gamma(\frac{n-1}{2}+p)} \left(\frac{1}{(p!)^2} \frac{\Gamma(\frac{\nu-1}{2}+p)}{\Gamma(\frac{\nu-1}{2})} \frac{\Gamma(\frac{\nu-1}{2}-p)}{\Gamma(\frac{\nu-1}{2})} \right.$$
$$\left. + 2\sum_{l=1}^{p} \frac{(-1)^l}{(p+l)!(p-l)!} \frac{\Gamma(\frac{\nu-1}{2}+p)}{\Gamma(\frac{\nu-1}{2}+l)} \frac{\Gamma(\frac{\nu-1}{2}-p)}{\Gamma(\frac{\nu-1}{2}-l)} \right) \tag{151}$$

$$= \frac{2^{3-\nu}\pi\Gamma(\nu-1)}{(\nu-2)\Gamma(\frac{n-1}{2}+p)\Gamma(\frac{n-1}{2}+p)} \cdot \frac{\Gamma(\frac{\nu-1}{2}-p)}{2^p\Gamma(\frac{\nu-1}{2})} \cdot \frac{(2p)!}{2^p p!} \cdot p! \left(\frac{1}{(p!)^2} \frac{\Gamma(\frac{\nu-1}{2}+p)}{\Gamma(\frac{\nu-1}{2})} \right.$$
$$\left. + 2\sum_{l=1}^{p} \frac{(-1)^l}{(p+l)!(p-l)!} \frac{\Gamma(\frac{\nu-1}{2}+p)}{\Gamma(\frac{\nu-1}{2}+l)} \frac{\Gamma(\frac{\nu-1}{2})}{\Gamma(\frac{\nu-1}{2}-l)} \right) \tag{152}$$

TODO: prove

$$p! \left(\frac{1}{(p!)^2} \frac{\Gamma(\frac{\nu-1}{2}+p)}{\Gamma(\frac{\nu-1}{2})} + 2\sum_{l=1}^{p} \frac{(-1)^l}{(p+l)!(p-l)!} \frac{\Gamma(\frac{\nu-1}{2}+p)}{\Gamma(\frac{\nu-1}{2}+l)} \frac{\Gamma(\frac{\nu-1}{2})}{\Gamma(\frac{\nu-1}{2}-l)} \right) \tag{153}$$

$$= \frac{1}{p!} \frac{\Gamma(-\frac{1}{2}+p)}{\Gamma(-\frac{1}{2})} + 2\sum_{l=1}^{p} \frac{(-1)^l p!}{(p+l)!(p-l)!} \frac{\Gamma(-\frac{1}{2}+p)}{\Gamma(-\frac{1}{2}+l)} \frac{\Gamma(-\frac{1}{2})}{\Gamma(-\frac{1}{2}-l)} \tag{154}$$

$$= 1 \tag{155}$$

$$\Rightarrow \hat{I}^{(2p)}(\nu) = \frac{2^{3-\nu}\pi\Gamma(\nu-1)}{(\nu-2)\Gamma(\frac{n-1}{2}+p)\Gamma(\frac{n-1}{2}-p)} \cdot \frac{\Gamma(\frac{\nu-1}{2}-p)}{2^p\Gamma(\frac{\nu-1}{2})} \cdot \frac{(2p)!}{2^p p!} \tag{156}$$

$$= \frac{\sqrt{\pi}(2p)!}{2^{2p}p!} \frac{\Gamma((\nu-2)/2)}{\Gamma(\frac{\nu-1}{2}+p)} \tag{157}$$

2.3.2 any collinearity and $-k, -l \in \mathbb{N}_0$

If $-k, -l \in \mathbb{N}_0$ $I_n^{(k,l)}$ can always be reduced in a straight forward manner to combinations of $\hat{I}^{(q)}(n)$ and this way one finds[4, Ch. 5][2, App. C]:

$$I_n^{(0,0)} = \hat{I}^{(0)}(n-1) \cdot \hat{I}^{(0)}(n) = \frac{2\pi}{n-3} \tag{158}$$

$$I_4^{(0,0)} = 2\pi \tag{159}$$

$$I_n^{(-1,0)} = \hat{I}^{(0)}(n-1) \cdot (a\hat{I}^{(0)}(n) + b\hat{I}^{(1)}(n)) = \frac{2\pi a}{n-3} \tag{160}$$

$$I_4^{(-1,0)} = 2\pi a \tag{161}$$

$$I_n^{(0,-1)} = \hat{I}^{(0)}(n-1) \cdot (A\hat{I}^{(0)}(n) + B\hat{I}^{(1)}(n)) + C\hat{I}^{(1)}(n-1)\hat{I}^{(0)}(n) \tag{162}$$

$$= \frac{2\pi A}{n-3} \tag{163}$$

$$I_4^{(0,-1)} = 2\pi A \tag{164}$$

$$I_n^{(-2,0)} = \hat{I}^{(0)}(n-1) \cdot (a^2\hat{I}^{(0)}(n) + 2ab\hat{I}^{(1)}(n) + b^2\hat{I}^{(2)}(n)) \tag{165}$$

$$= 2\pi \left(\frac{a^2(n-1) + b^2}{(n-1)(n-3)} \right) \tag{166}$$

$$I_4^{(-2,0)} = 2\pi(a^2 + b^2/3) \tag{167}$$

$$I_n^{(0,-2)} = \hat{I}^{(0)}(n-1) \cdot (A^2\hat{I}^{(0)}(n) + B^2\hat{I}^{(2)}(n)) + C^2\hat{I}^{(2)}(n-1)\hat{I}^{(0)}(n+2) \tag{168}$$

$$= 2\pi \left(\frac{A^2(n-1) + B^2 + C^2}{(n-1)(n-3)} \right) \tag{169}$$

$$I_4^{(0,-2)} = 2\pi(A^2 + (B^2 + C^2)/3) \tag{170}$$

$$I_n^{(-1,-1)} = \hat{I}^{(0)}(n-1) \cdot (aA\hat{I}^{(0)}(n) + bB\hat{I}^{(2)}(n)) = 2\pi \left(\frac{aA(n-1) + bB}{(n-1)(n-3)} \right) \tag{171}$$

$$I_4^{(-1,-1)} = 2\pi(aA + bB/3) \tag{172}$$

2.3.3 single collinear a

If $-l \in \mathcal{N}$ one finds:

$$\hat{I}_a^{(k,q)}(\nu) = \int_0^\pi \frac{\sin^{\nu-3} t}{(1 - \cos(t))^k} \cos^q(t)\, dt \tag{173}$$

$$= \int_0^\pi \frac{\sin^{\nu-3}(t)}{(1 - \cos^2(t))^k} \cos^q(t)(1 + \cos(t))^k\, dt \tag{174}$$

$$= \int_0^\pi \sin^{\nu-3-2k}(t) \cos^q(t)(1 + \cos(t))^k\, dt \tag{175}$$

$$= \sum_{l=0}^k \binom{k}{l} \hat{I}^{(q+l)}(\nu - 2k) \tag{176}$$

this way one finds[4, Ch. 5][2, App. C]:

$$I_{a,n}^{(1,0)} = \frac{1}{a} \hat{I}^{(0)}(n-1) \cdot \hat{I}^{(0)}(n-2) \tag{177}$$

$$= \frac{2\pi}{a(n-4)} \tag{178}$$

$$I_{a,n}^{(1,-1)} = \frac{1}{a} \hat{I}^{(0)}(n-1) \cdot \left(A\hat{I}^{(0)}(n-2) + B\hat{I}^{(2)}(n-2) \right) \tag{179}$$

$$= \frac{2\pi}{a} \frac{(A(n-3)+B)}{(n-3)(n-4)} \approx \frac{2\pi}{a}\left(\frac{A+B}{\epsilon} - 2B + O(\epsilon) \right) \tag{180}$$

$$I_{a,n}^{(1,-2)} = \frac{1}{a}\left(\hat{I}^{(0)}(n-1) \cdot \left(A^2\hat{I}^{(0)}(n-2) + (B^2 + 2AB)\hat{I}^{(2)}(n-2) \right) + C^2\hat{I}^{(2)}(n-1)\hat{I}^{(0)}(n) \right) \tag{181}$$

$$= \frac{2\pi}{a}\left(\frac{A^2}{n-4} + \frac{2AB + B^2}{(n-4)(n-3)} + \frac{C^2}{(n-3)(n-2)} \right) \tag{182}$$

$$\approx \frac{2\pi}{a}\left(\frac{(A+B)^2}{\epsilon} + \frac{C^2}{2} - 2AB - B^2 + O(\epsilon) \right) \tag{183}$$

$$I_{a,n}^{(2,0)} = \frac{1}{a^2} \hat{I}^{(0)}(n-1) \cdot \left(\hat{I}^{(0)}(n-4) + \hat{I}^{(2)}(n-4) \right) \tag{184}$$

$$= \frac{2\pi}{a^2(n-6)} \approx -\frac{\pi}{a^2} + O(\epsilon) \tag{185}$$

$$I_{a,n}^{(2,-1)} = \frac{1}{a^2} \hat{I}^{(0)}(n-1) \cdot \left(A\left(\hat{I}^{(0)}(n-4) + \hat{I}^{(2)}(n-4) \right) + 2B\hat{I}^{(2)}(n-4) \right) \tag{186}$$

$$= \frac{2\pi}{a^2} \left(\frac{A}{n-6} + \frac{2B}{(n-6)(n-4)} \right) \approx -\frac{2\pi}{a^2} \left(\frac{B}{\epsilon} + \frac{A+B}{2} \right) + O(\epsilon) \tag{187}$$

$$I_{a,n}^{(2,-2)} = \frac{1}{a^2} \Big(\hat{I}^{(0)}(n-1) \cdot \left(A^2(\hat{I}^{(0)}(n-4) + \hat{I}^{(2)}(n-4)) + 4AB\hat{I}^{(2)}(n-4) \right.$$
$$\left. + B^2(\hat{I}^{(2)}(n-4) + \hat{I}^{(4)}(n-4)) \right) + C^2\hat{I}^{(2)}(n-1)(\hat{I}^{(0)}(n-2) + \hat{I}^{(2)}(n-2)) \Big) \tag{188}$$

$$= \frac{2\pi}{a^2} \left(\frac{A^2}{n-6} + \frac{4AB}{(n-6)(n-4)} + \frac{B^2 n}{(n-6)(n-4)(n-3)} + \frac{C^2}{(n-4)(n-3)} \right) \tag{189}$$

$$\approx \frac{2\pi}{a^2} \left(\frac{-2AB - 2B^2 + C^2}{\epsilon} + \frac{B^2 - A^2}{2} - AB - C^2 + O(\epsilon) \right) \tag{190}$$

$$\tag{191}$$

It is[4, Ch. 5]:

$$I_{a,n}^{(1,1)} = \frac{\pi}{a(A+B)} \left(\frac{2}{\epsilon} + \ln\left(\frac{(A+B)^2}{A^2 - B^2 - C^2} \right) \right) + O(\epsilon) \tag{192}$$

$$I_{a,n}^{(2,1)} = \frac{\pi}{a^2(A+B)} \left(\frac{B^2 + AB + C^2}{(A+B)^2} \left(\frac{2}{\epsilon} + \ln\left(\frac{(A+B)^2}{A^2 - B^2 - C^2} \right) \right) \right.$$
$$\left. - \frac{2C^2}{(A+B)^2} - 1 \right) + O(\epsilon) \tag{193}$$

From this are the following integrals derived[4, Ch. 5]:

$$I_{a,n}^{(1,2)} = -\frac{\partial}{\partial A} I_{a,n}^{(1,1)} \tag{194}$$

$$= \frac{\pi}{a(A+B)^2} \left(\frac{2}{\epsilon} + \ln\left(\frac{(A+B)^2}{A^2 - B^2 - C^2} \right) + \frac{2A(A+B)}{A^2 - B^2 - C^2} - 2 \right) + O(\epsilon) \tag{195}$$

$$I_{a,n}^{(2,2)} = -\frac{\partial}{\partial A} I_{a,n}^{(2,1)} \tag{196}$$

$$= \frac{\pi}{a^2(A+B)^2} \left(\frac{2B^2 + 2AB + 3C^2}{(A+B)^2} \left(\frac{2}{\epsilon} + \ln\left(\frac{(A+B)^2}{A^2 - B^2 - C^2} \right) \right) \right.$$
$$\left. + \frac{2A^2}{A^2 - B^2 - C^2} - \frac{8C^2}{(A+B)^2} - 3 \right) + O(\epsilon) \tag{197}$$

If $-k \in \mathcal{N}$ use I_0 with $b = -a$.

14

2.3.4 double collinear

as said in [4, Ch. 5]: if $0 \leq -\frac{C}{A}, \frac{B}{A} \leq 1$ use [3, eq. A11] with $\cos \kappa = -\frac{B}{A}$:

$$I_{aA,n}^{(k,l)} = \frac{2\pi 2^{-(k+l)}}{a^k A^l} \frac{\Gamma(1+\epsilon)}{\Gamma^2(1+\epsilon/2)} B(1 + \frac{\epsilon}{2} - k, 1 + \frac{\epsilon}{2} - l)_2 F_1\left(k, l; 1 + \frac{\epsilon}{2}; \frac{A-B}{2A}\right) \quad (198)$$

but we will not need it here.

2.3.5 non collinear

If $-l \in \mathcal{N}$ the θ_2 integration can be performed using the integral helper and the problem reduces then to the following integral:

$$\hat{I}_0^{(k,q,p)}(\epsilon)$$

$$= \int_0^\pi d\theta_1 \frac{\sin^{1+\epsilon}(\theta_1) \sin^q(\theta_1) \cos^p(\theta_1)}{(a + b \cos(\theta_1))^k} \quad (199)$$

$$= \frac{1}{2a^k}\left((1+(-1)^p)B\left(\frac{2+q+\epsilon}{2}, \frac{1+p}{2}\right) {}_3F_2\left(\frac{1+k}{2}, \frac{k}{2}, \frac{1+p}{2}; \frac{1}{2}, \frac{3+q+p+\epsilon}{2}; \frac{b^2}{a^2}\right)\right.$$

$$\left.\frac{b}{a}k(-1+(-1)^p)B\left(\frac{2+q+\epsilon}{2}, \frac{2+p}{2}\right) {}_3F_2\left(\frac{1+k}{2}, \frac{2+k}{2}, \frac{2+p}{2}; \frac{3}{2}, \frac{4+q+p+\epsilon}{2}; \frac{b^2}{a^2}\right)\right) \quad (200)$$

for $k = 1$ this simplifies to

$$\hat{I}_0^{(1,q,p)}(\epsilon)$$

$$= \int_0^\pi d\theta_1 \frac{\sin^{1+\epsilon}(\theta_1) \sin^q(\theta_1) \cos^p(\theta_1)}{(a + b \cos(\theta_1))} \quad (201)$$

$$= \frac{1}{2a}\left((1+(-1)^p)B\left(\frac{2+q+\epsilon}{2}, \frac{1+p}{2}\right) {}_2F_1\left(1, \frac{1+p}{2}; \frac{3+q+p+\epsilon}{2}; \frac{b^2}{a^2}\right)\right.$$

$$\left.\frac{b}{a}(-1+(-1)^p)B\left(\frac{2+q+\epsilon}{2}, \frac{2+p}{2}\right) {}_2F_1\left(1, \frac{2+p}{2}; \frac{4+q+p+\epsilon}{2}; \frac{b^2}{a^2}\right)\right) \quad (202)$$

TODO: structure does NOT match [4, Ch. 5] - neither A,B,C nor ϵ FiXme Error: fix to Bojak

For $I_{0,n}^{(1,1)}$ one finds[4, Ch. 5]:

$$I_{0,n}^{(1,1)} = \frac{\pi}{\sqrt{X}} \ln\left(\frac{aA - bB + \sqrt{X}}{aA - bC - \sqrt{X}}\right) \quad (203)$$

$$\text{with } X = (aB - bA)^2 - (a^2 - b^2)C^2 \quad (204)$$

15

$I_{0,n}^{(1,-3)}$ is given by [4, Ch. 5] and from those two all other integrals can be deduced using the techiques described in [4, Ch. 5]: increase k or l by differentiation or interchange k and l by a rotation:

$$I_n^{(k,l)} = I_n^{(l,k)} \left(a \leftrightarrow A, b \to -\sqrt{B^2 + C^2}, B \to \frac{-bB}{\sqrt{B^2+C^2}}, C \to \frac{-bC}{\sqrt{B^2+C^2}} \right) \qquad (205)$$

2.4 needed set in matrix element

define a shortcut:
$$\mathcal{V}_{a,b}(x,y) = \left(x^k y^l \right)_{k=0..a, l=0..b} \qquad (206)$$

It is

$$A_{G,1} = \sum_{k,l=0}^{3} \left(\mathcal{C}_{A_{G,1}} \right)_{(k,l)} t'^{-2+k} u_7^{-2+l} \qquad = \mathrm{tr}\left(\mathcal{C}_{A_{G,1}} \frac{\mathcal{V}_{3,3}(t',u_7)^t}{t'^2 u_7^2} \right) \qquad (207)$$

$$A_{L,1} = \sum_{k=0}^{4} \sum_{l=0}^{2} \left(\mathcal{C}_{A_{L,1}} \right)_{(k,l)} t'^{-2+k} u_7^{-2+l} \qquad = \mathrm{tr}\left(\mathcal{C}_{A_{L,1}} \frac{\mathcal{V}_{4,2}(t',u_7)^t}{t'^2 u_7^2} \right) \qquad (208)$$

and we will thus need the integrals

$$\left(\mathcal{I}_{A_{G,1}} \right)_{(k,l)} = \int d\Omega_n \frac{1}{t'^2 u_7^2} \left(\mathcal{V}_{3,3}(t',u_7) \right)_{(k,l)} \qquad (209)$$

$$\left(\mathcal{I}_{A_{L,1}} \right)_{(k,l)} = \int d\Omega_n \frac{1}{t'^2 u_7^2} \left(\mathcal{V}_{4,2}(t',u_7) \right)_{(k,l)} \qquad (210)$$

with

$$a(t') = -b(t') = -2\omega_1\omega_2 \qquad = -\frac{s_4(s'+t_1)}{2(s_4+m^2)} \qquad (211)$$

$$A(u_7) = q^2 - 2q_0 E_1 \qquad = q^2 - \frac{(s_4+2m^2)(s+u_1)}{2(s_4+m^2)} \qquad (212)$$

$$B(u_7) = -2\omega_2(|\vec{p}_2|\cos\psi - \omega_1) \qquad = \frac{s_4}{2}\left(1 - \frac{s+u_1}{s_4+m^2} + \frac{s'-t_1}{s'+t_1} \right) \qquad (213)$$

$$C(u_7) = -2\omega_2 |\vec{p}_2| \sin\psi \qquad (214)$$

that is $I_{a,n}^{(-2...2,-1...2)}$. With this we find

$$A + B = -\frac{t_1 u_1}{s'+t_1} \qquad (215)$$

$$\frac{(A+B)^2}{A^2 - B^2 - C^2} = \frac{(s_4+m^2)t_1^2 u_1^2}{(s'+t_1)^2(s_4 q^2 t_1 + m^2(s'+u_1)^2)} \qquad (216)$$

$$2B(A+B) + 3C^2 = -\frac{s_4(m^2 s'(3s's_4 + 2t_1 u_1) + t_1(q^2(s_4-u_1)(3s_4-u_1) - u_1(s's_4+t_1u_1)))}{(s_4+m^2)(s'+t_1)^2} \qquad (217)$$

With this we get

$$\int d\Omega_n A_{j,1} = \text{tr}(\mathcal{C}_{A_{j,1}} \left(\mathcal{I}_{A_{j,1}} \right)^t) \qquad j = G, L \tag{218}$$

It is

$$A_{G,2} = \sum_{k,l=0}^{3} \left(\mathcal{C}_{A_{G,2}} \right)_{(k,l)} s_5^{-2+k} u'^{-2+l} \qquad = \text{tr}\left(\mathcal{C}_{A_{G,2}} \frac{\mathcal{V}_{3,3}(s_5, u')^t}{s_5^2 u'^2} \right) \tag{219}$$

$$A_{L,2} = \sum_{k=0}^{4} \sum_{l=0}^{3} \left(\mathcal{C}_{A_{G,2}} \right)_{(k,l)} s_5^{-2+k} u'^{-2+l} \qquad = \text{tr}\left(\mathcal{C}_{A_{L,2}} \frac{\mathcal{V}_{4,3}(s_5, u')^t}{s_5^2 u'^2} \right) \tag{220}$$

and we will thus need the integrals

$$\left(\mathcal{I}_{A_{G,2}} \right)_{(k,l)} = \int d\Omega_n \frac{1}{s_5^2 u'^2} \left(\mathcal{V}_{3,3}(s_5, u') \right)_{(k,l)} \tag{221}$$

$$\left(\mathcal{I}_{A_{L,2}} \right)_{(k,l)} = \int d\Omega_n \frac{1}{s_5^2 u'^2} \left(\mathcal{V}_{4,3}(s_5, u') \right)_{(k,l)} \tag{222}$$

but as both s_5 and u' are of $[ABC]$ type we have to apply partial fractioning, following the ideas of [4, Ch. 5]. It is

$$(43): \qquad s_5 = s - q^2 + t' + u' \tag{223}$$

so end up with a form of $\mathcal{V}(p+q, q)$ where p is $[ab]$ and q and $p+q$ are $[ABC]$. The aim is then to get to a form with fractions of $\frac{p}{q}$ and/or $\frac{p+q}{p}$ and indeed this can be achieved. Define

$$\mathcal{T} = \begin{pmatrix} \{-2,1,2,1\} & \{1, \ 0,-1,-1\} & \{0,0,0,1\} & \{0,0,1,-1\} \\ \{-1,1,1,0\} & \{1,-1, \ 0, \ 0\} & \{0,0,1,0\} & \{0,0,1,-1\} \\ \{ \ 0,1,0,0\} & \{1, \ 0, \ 0, \ 0\} & \{1,0,0,0\} & \{0,0,1,-1\} \\ \{ \ 1,1,0,0\} & \{1, \ 1, \ 0, \ 0\} & \{1,1,0,0\} & \{0,0,1,-1\} \end{pmatrix} \tag{224}$$

$$\left(\mathcal{W}(x,y) \right)_{(k,l)} = x^{-2+p_x(k+l)} y^{-2+p_y(k+l)} \tag{225}$$

$$p_x(s) = \begin{cases} s & \text{if } s \le 3 \\ 3 & \text{else} \end{cases} \qquad p_y(s) = 3 - p_x(6 - s) \begin{cases} 0 & \text{if } s \le 3 \\ s - 3 & \text{else} \end{cases} \tag{226}$$

$$\Rightarrow \mathcal{W}(x,y) = \begin{pmatrix} x^{-2}y^{-2} & x^{-1}y^{-2} & y^{-2} & xy^{-2} \\ x^{-1}y^{-2} & y^{-2} & xy^{-2} & xy^{-1} \\ y^{-2} & xy^{-2} & xy^{-1} & x \\ xy^{-2} & xy^{-1} & x & xy \end{pmatrix} \tag{227}$$

$$\left(\mathcal{W}^*(p,q) \right)_{(k,l)} = \left\{ \frac{q}{p} \mathcal{W}(p,q), \mathcal{W}(p,q), \frac{p+q}{p} \mathcal{W}(p, p+q), \mathcal{W}(p, p+q) \right\}_{(k,l)} \tag{228}$$

we then find:

$$\left(\mathcal{V}(p+q, q) \right)_{(k,l)} = \mathcal{T}_{(k,l)} \cdot \mathcal{W}^*(p,q)_{(k,l)} \tag{229}$$

where the equation has to be read separate for each (k,l), i.e. "$\cdot$" applies to the scalar $4x4$-product of the $\{\}$s. As $\mathcal{W}^t = \mathcal{W}$, $\mathcal{W}$ has 10 unique entries and thus for $\mathcal{W}^*$ are 40 unique integrals needed: $I_0^{(-1...3, -2...2)}$.
